Z-transform

Oppenheim and Schafer

Problem 3.12(a) Sketch the pole-zero plot for

$$X_1(n) = \frac{1 - 1/2z^{-1}}{1 + 2z^{-1}} \quad (1)$$

and shade the region of convergence:

Solution: Given that,

$$X_1(n) = \frac{1 - 1/2z^{-1}}{1 + 2z^{-1}} \quad (2)$$

As we know that, the numerator gives us the zeros and denominator gives the poles of a Z-transform.

$$1 - 1/2z^{-1} = 0 \quad (3)$$

On solving, we get the zero $1/2$.
Similarly,

$$1 + 2z^{-1} = 0 \quad (4)$$

On solving, we get the pole -2 .

Since the $x_3(n)$ is absolutely summable, the ROC must include the unit circle: $\frac{2}{3} < |x| < \frac{3}{2}$
